Iterative and Incremental Refinement of Microservice-based Architectures and SLOs

Agility with Microservice Programming
Sandro Speth, Sarah Stieß, Sebastian
Frank, and Steffen Becker

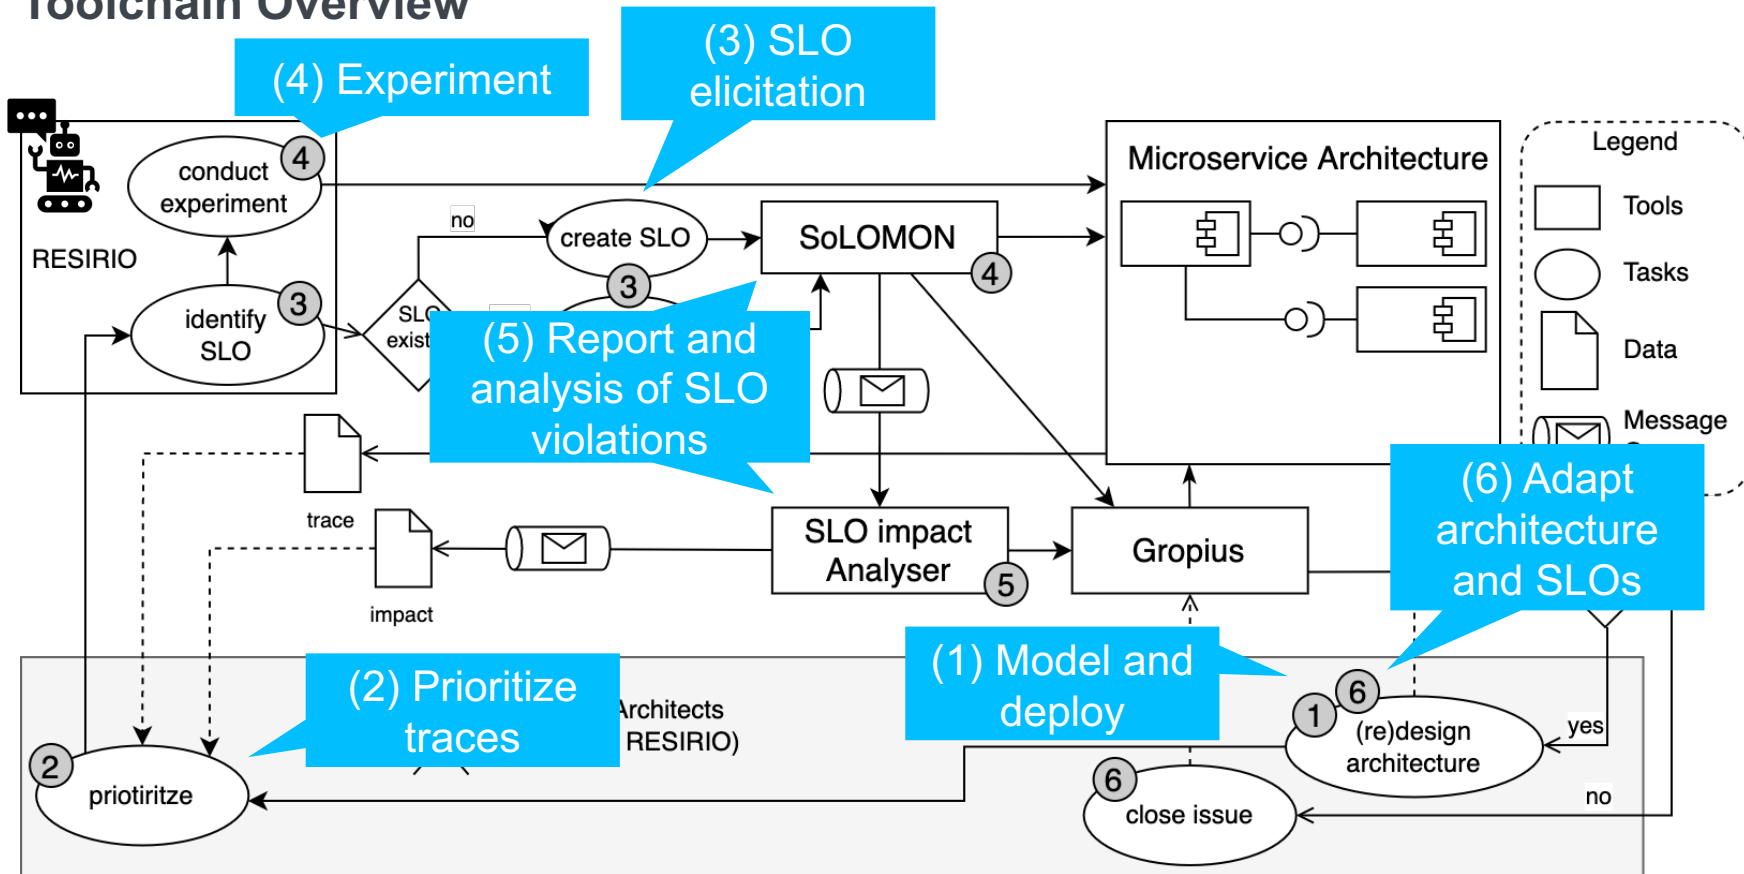

Motivation

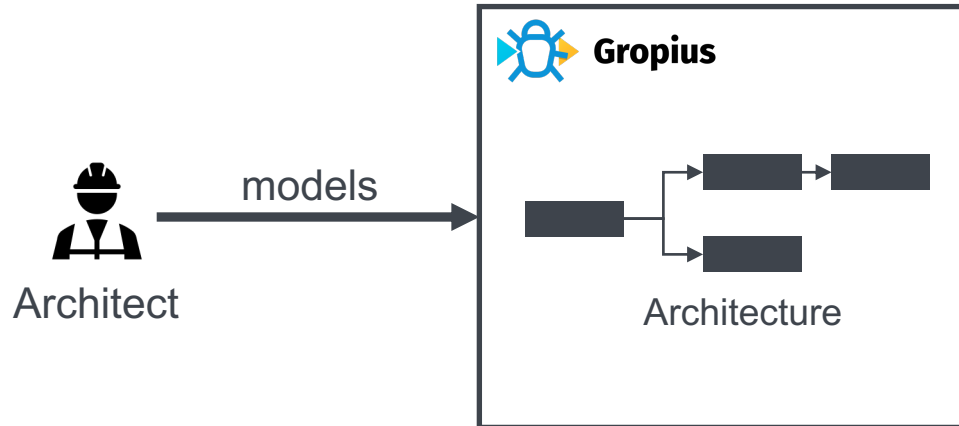

Objective

We require an *interactive* toolchain to support the software architect in *iteratively* and *incrementally adapting SLOs* and *architecture* alongside each other

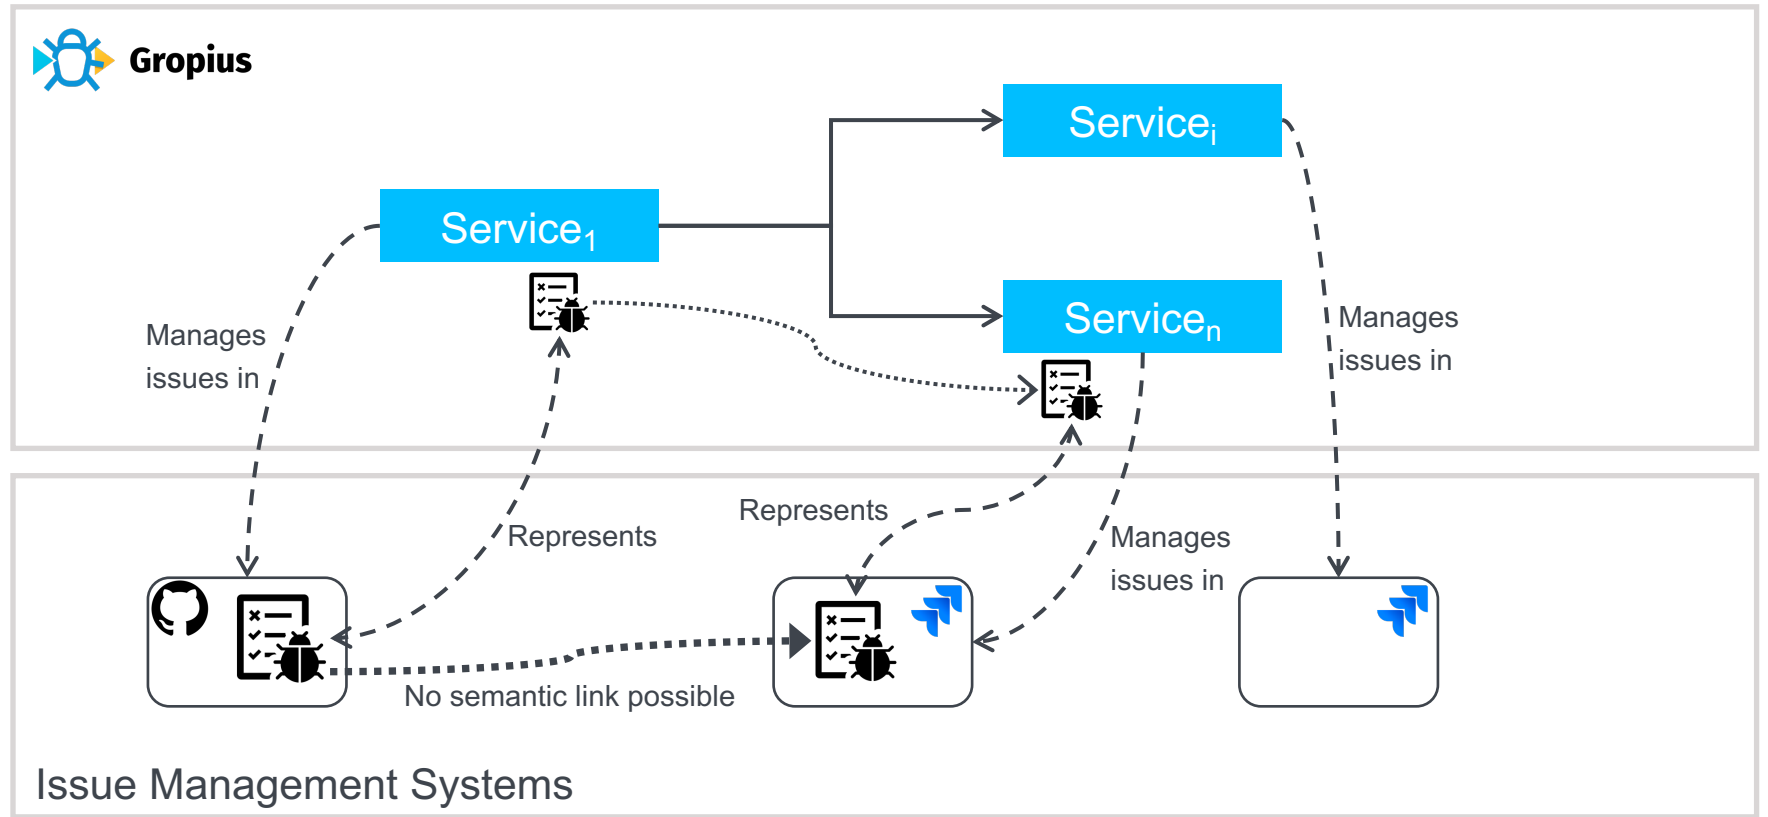

Toolchain Overview

Model and Deploy

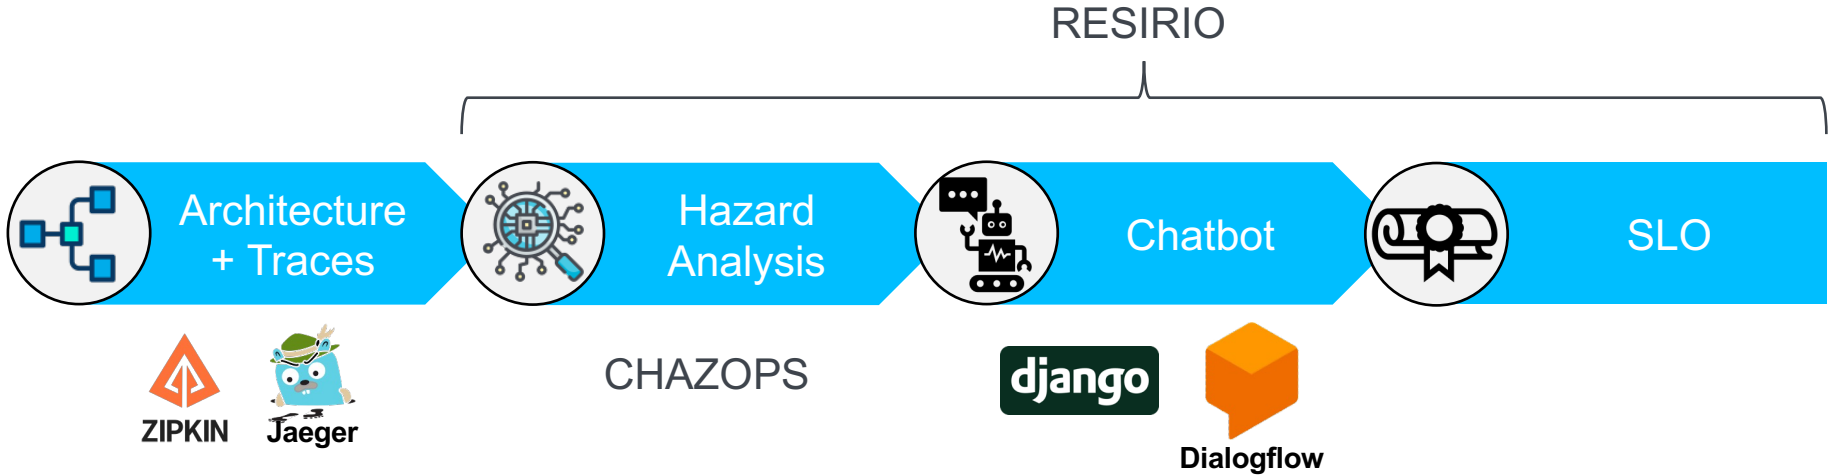

Gropius

Model and Deploy

Prioritize Traces

SLO Elicitation

Traces

Step 4 - Specify the response for `getLeftTicketOfInterval`
A response defines what action should be performed against the stimulus.

Step 5 - Specify the response measure for `getLeftTicketOfInterval`
A response measure quantifies the response.

What would be an **optimal response time**?

In **how many cases** should this hold?

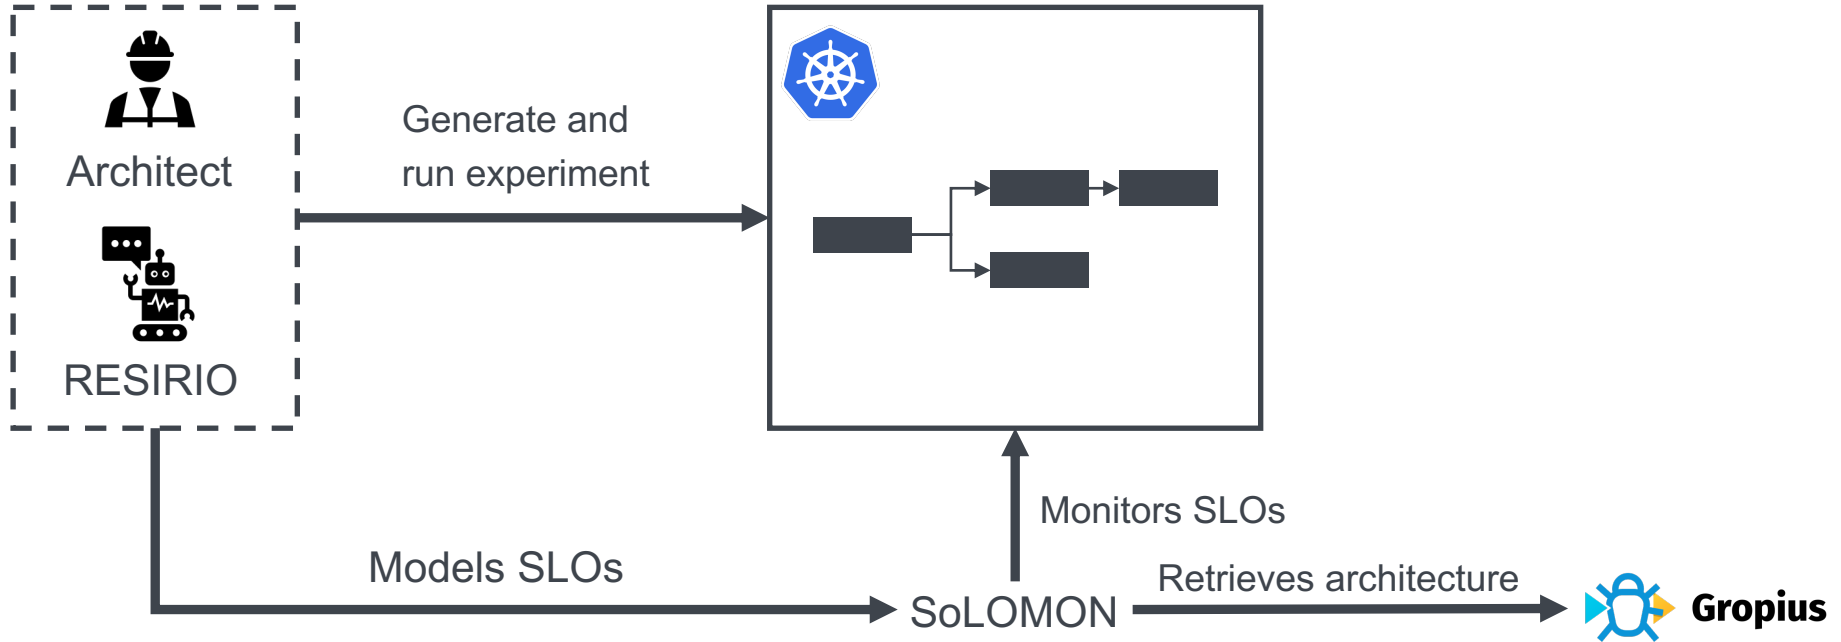

How long is the **non-optimal** behavior tolerable?

Source	test
Environment	test
Response	Service should return to normal performance
Response Measure	Normal response time is 500ms (holds in 97% of cases). Within 30min after occurrence of the stimuli the response times return to normal values.

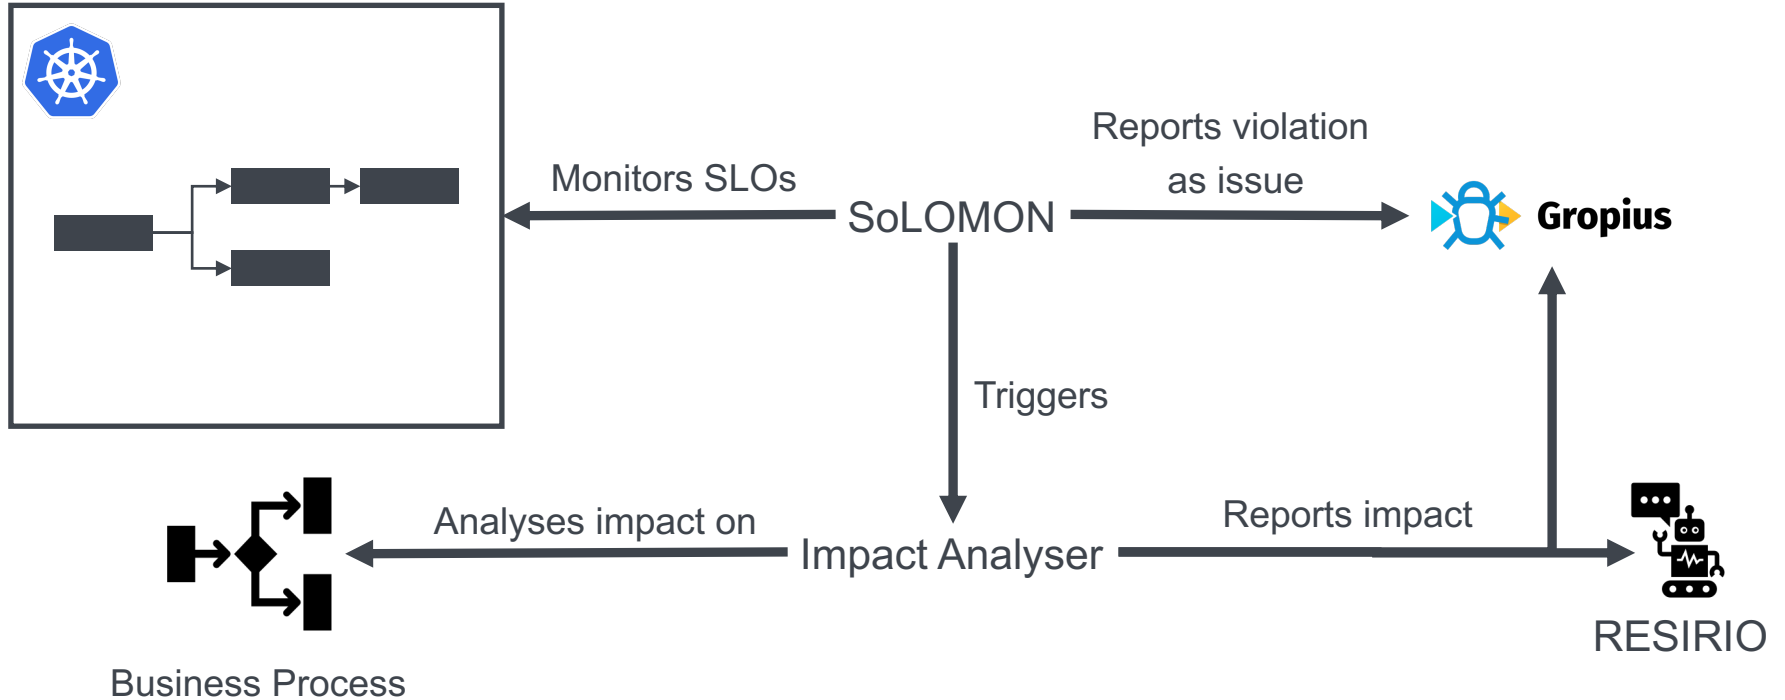

SoLOMON

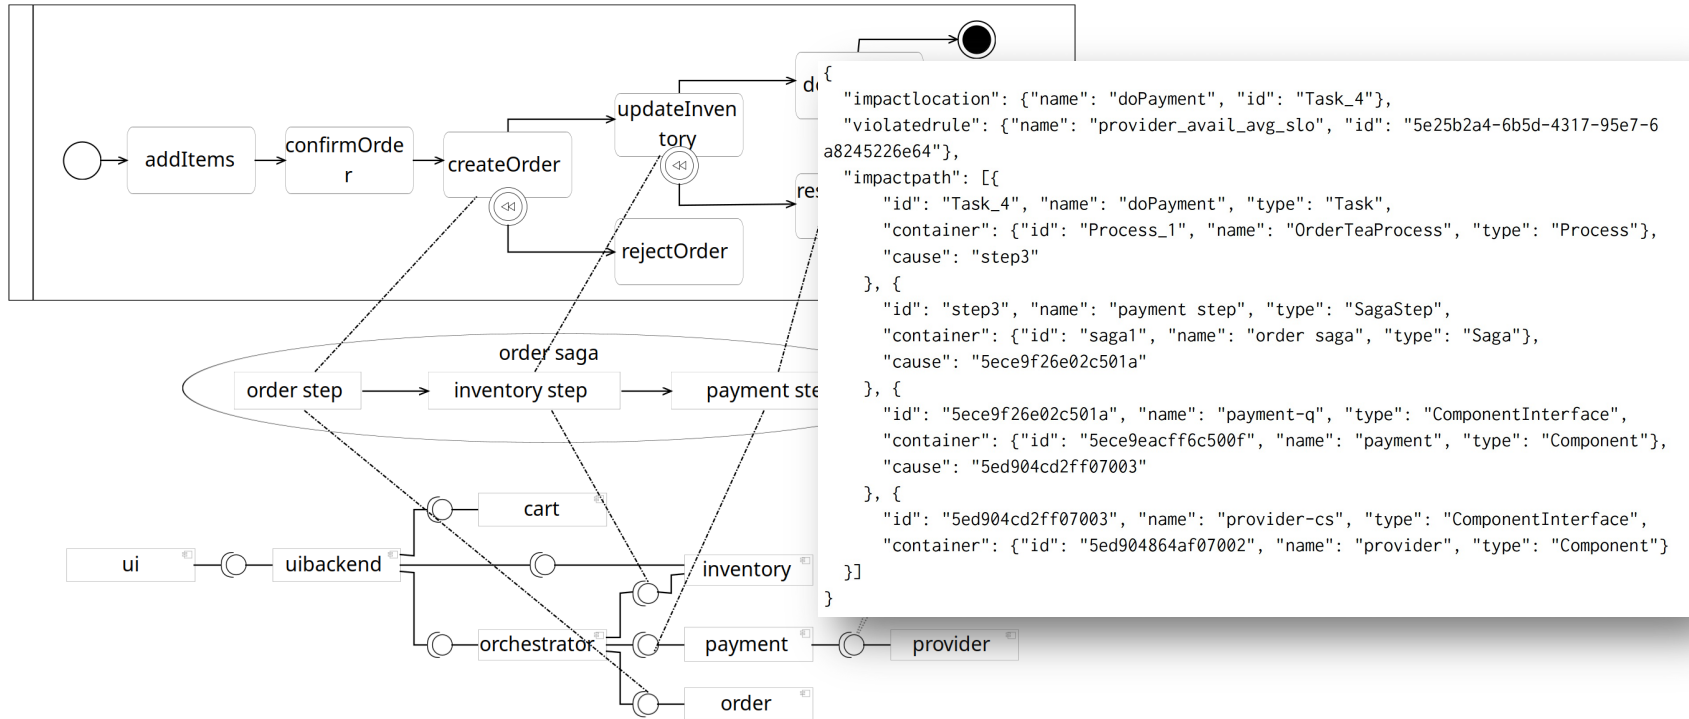

Conduct Experiment

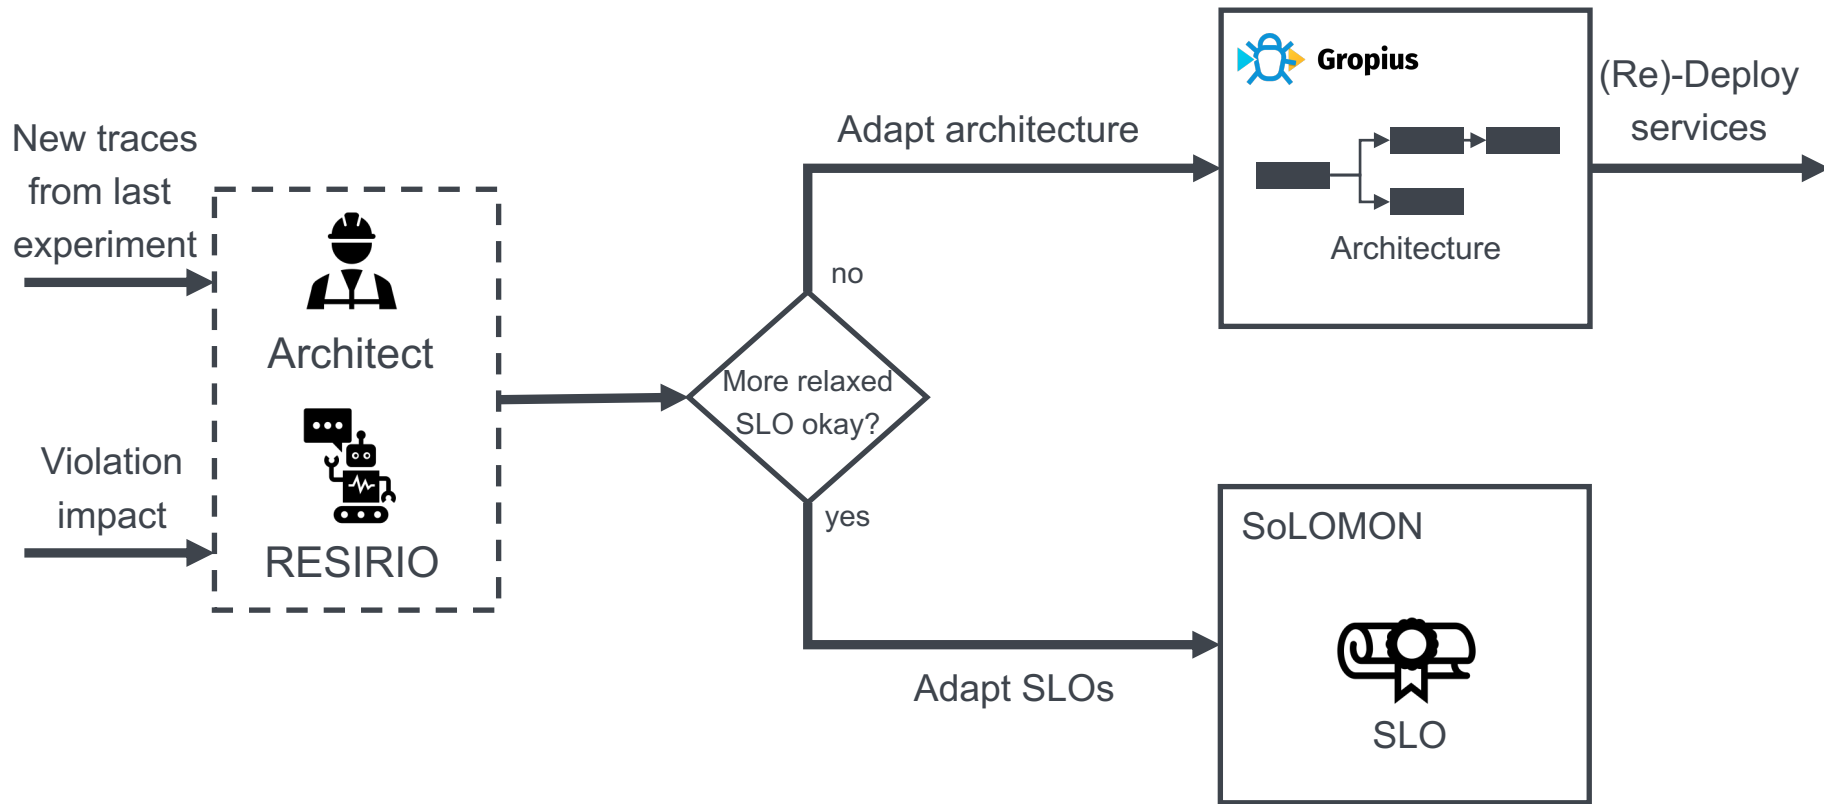

Reporting and Analysis of SLO Violations

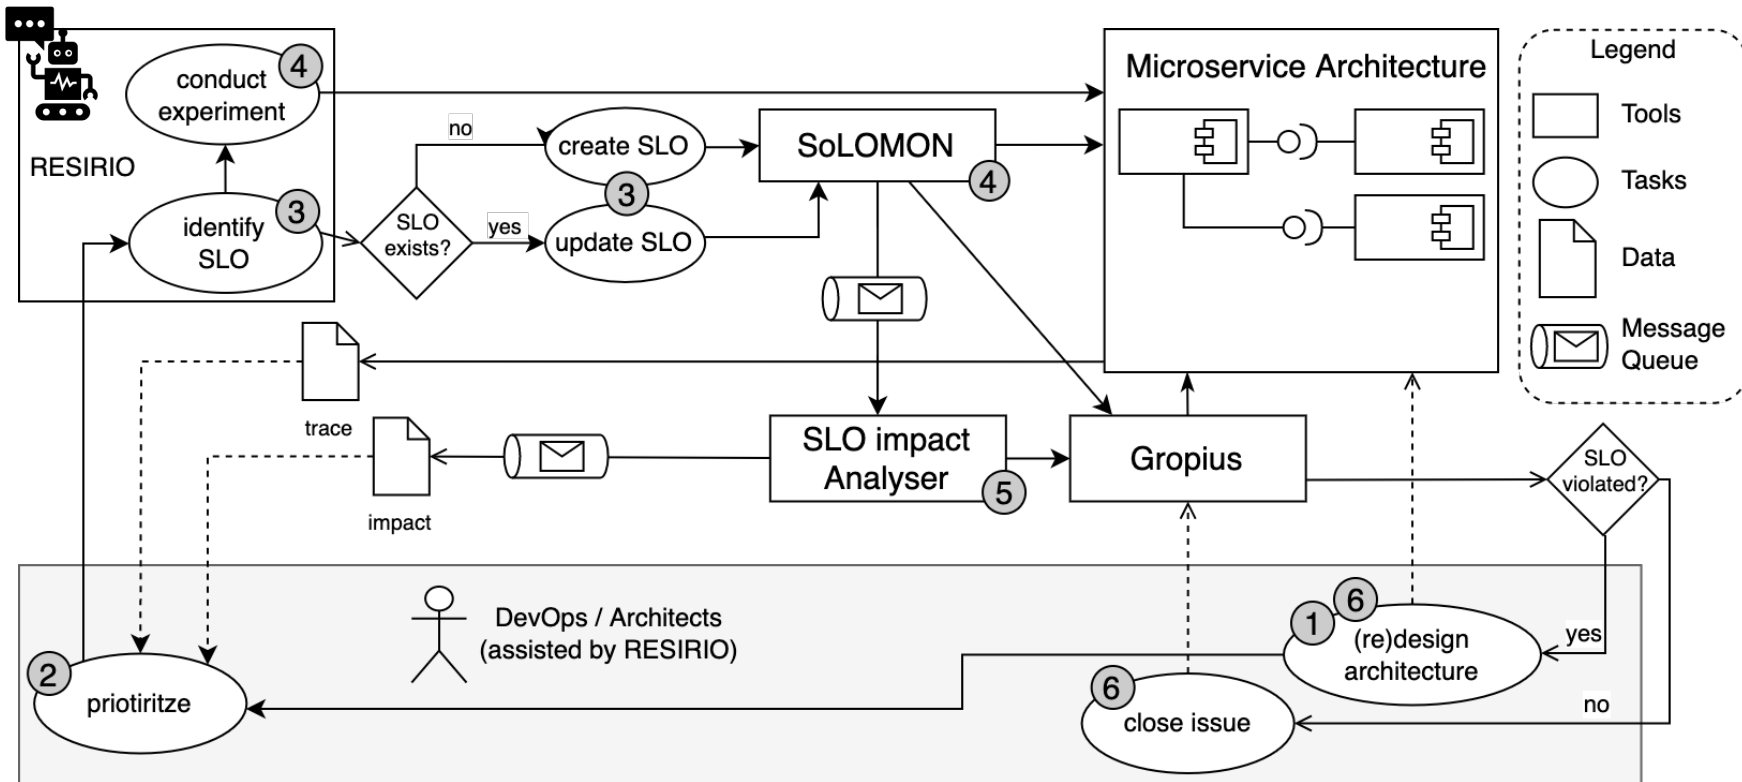

Impact Analyser

Adapt Architecture and SLOs
